is evident that many PAs who completed a residency training program have a positive outlook on their training as it pertains to their job. It is also clear that while base income is not likely to be increased because of residency training, total annual income may be affected as a result of better opportunities for additional pay. Finally, it seems likely that residency training may impact aspects of job responsibility, and more study would be helpful in confirming these results.

Michael Anick is a PA in family and internal medicine at the Martin Luther King Heritage Health Center in Milwaukee. Jim Carlson is a PA in occupational medicine and dermatology in Mundelein, Ill. Patrick Knott is an associate professor and the chair of the physician assistant program at Finch University of Health Sciences in North Chicago, Ill. He is also co-director of the physician assistant residency program in orthopaedic surgery at Illinois Bone and Joint Institute in Des Plaines, Ill.

Acknowledgements: In addition to the authors, the original research, writing and presentation of the material in this project was conducted by Lisa Fohd, PA-C; Miryada Kheir, PA-C; Christy Kuennen, PA-C; Ian Mackey, PA-C; David Miller, PA-C; and Curt Stylp, PA-C. Assistance was also given by the AAPA Census Survey.
